FUTURE

MICROGRAVITY AFFECTS POLLEN TUBE DEVELOPMENT:

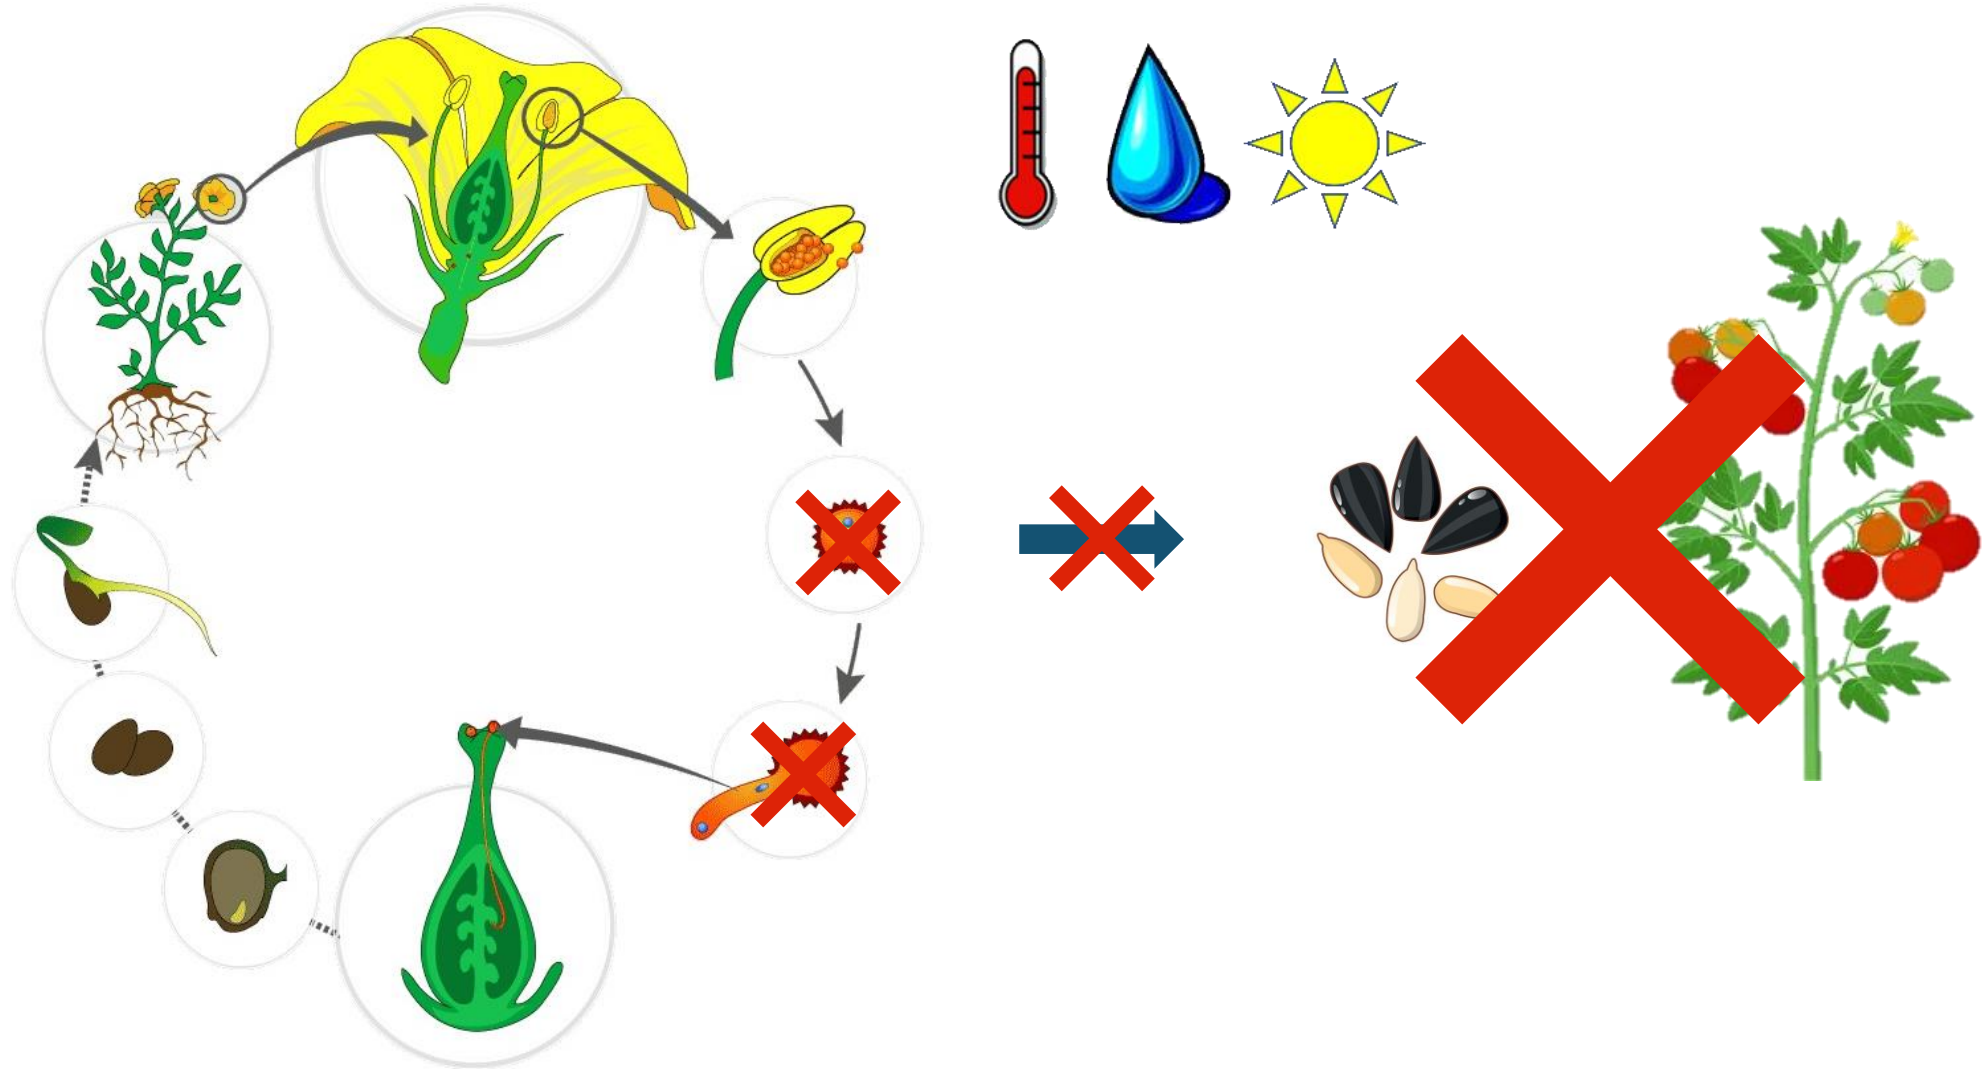

THE KEY ROLE OF POLLEN IN SEED-TO-SEED CYCLES OF SPACE CANDIDATE CROPS

REVIEW ARTICLE

Microgravity effects on different stages of higher plant life cycle and completion of the *seed-to-seed* cycle

V. De Micco, S. De Pascale, R. Paradiso & G. Aronne

Department of Agriculture, University of Naples Federico II, Portici, Naples, Italy

CHOICE OF THE SPACE CROPS

Micro-tom

Fruits

Clinostat

- Seed and fruits formed in altered gravity conditions
- Seed and embryos development compromised

Investigation on pollen functionality under microgravity is required to ensure seed and fruit production over repeated seed-to-seed cycles

Brassica rapa

Leaves

Microgravity

Research questions

1. Effect of simulated microgravity on pollen tube development
2. Interference of altered gravity on pollen tube path (pollen gravitropism)

METHODOLOGICAL APPROACH

Gravitropism on
pollen tubes

Micro-tom

Brassica rapa

CONCLUDING REMARKS

- Simulated microgravity significantly affects pollen tube development depending on the space crop tested
- Clinostat treatment reduced pollen capability to germinate potentially reducing fertilization success and seed/fruits production
- Despite simulated microgravity interfered with pollen tube path (tortuosity), pollen tube direction in both species showed no gravitropic response

New experiment on the ISS to assess reproductive features and ensure feasibility of seed-to-seed-to-seed...
